

ABSTRACT

In a pointing device (1), device, strain sensors (7A-7D) sensors are formed on a sensor substrate (2) substrate at positions partially overlapping with a lower surface of a fixed part (5) part of a stick member (3) member so that a portion of the substrate (2) substrate in which the largest stress concentrates by operation of an operating part (4) part of the stick member (3) member overlaps with each strain sensor (7A-7D) sensor. When such pointing device 1 device is installed on a notebook-sized personal computer (20) computer, the stick member (3) member is operated to move a cursor (K) cursor displayed on a liquid crystal display (23) display. Accordingly, the cursor (K) cursor can accurately be moved by operation of the stick member with good operability.
